SI.II Compiler and hardware

With the exception of the 20 replicates performed for MiPPE cyclohexane, all simulations are run on a Linux 4.4.0-112-generic x86_64 on an Intel(R) Xeon(R) CPU E5-2699 v4 @ 2.20GHz machine. On this machine, GOMC was erroneously compiled using the sub-optimal GNU compiler collection (GCC) instead of the preferred Intel compiler. GOMC compiled with the Intel compiler typically runs approximately twice as fast as GOMC compiled with the GCC compiler.

The 20 replicate simulations for MiPPE cyclohexane utilize several different machine hardware architectures, listed in Table SI.IV. GOMC was compiled with the Intel compiler on each of these machines.

SI.IV Case study: Cyclohexane optimization

SI.IV.1 Minimum number of effective snapshots

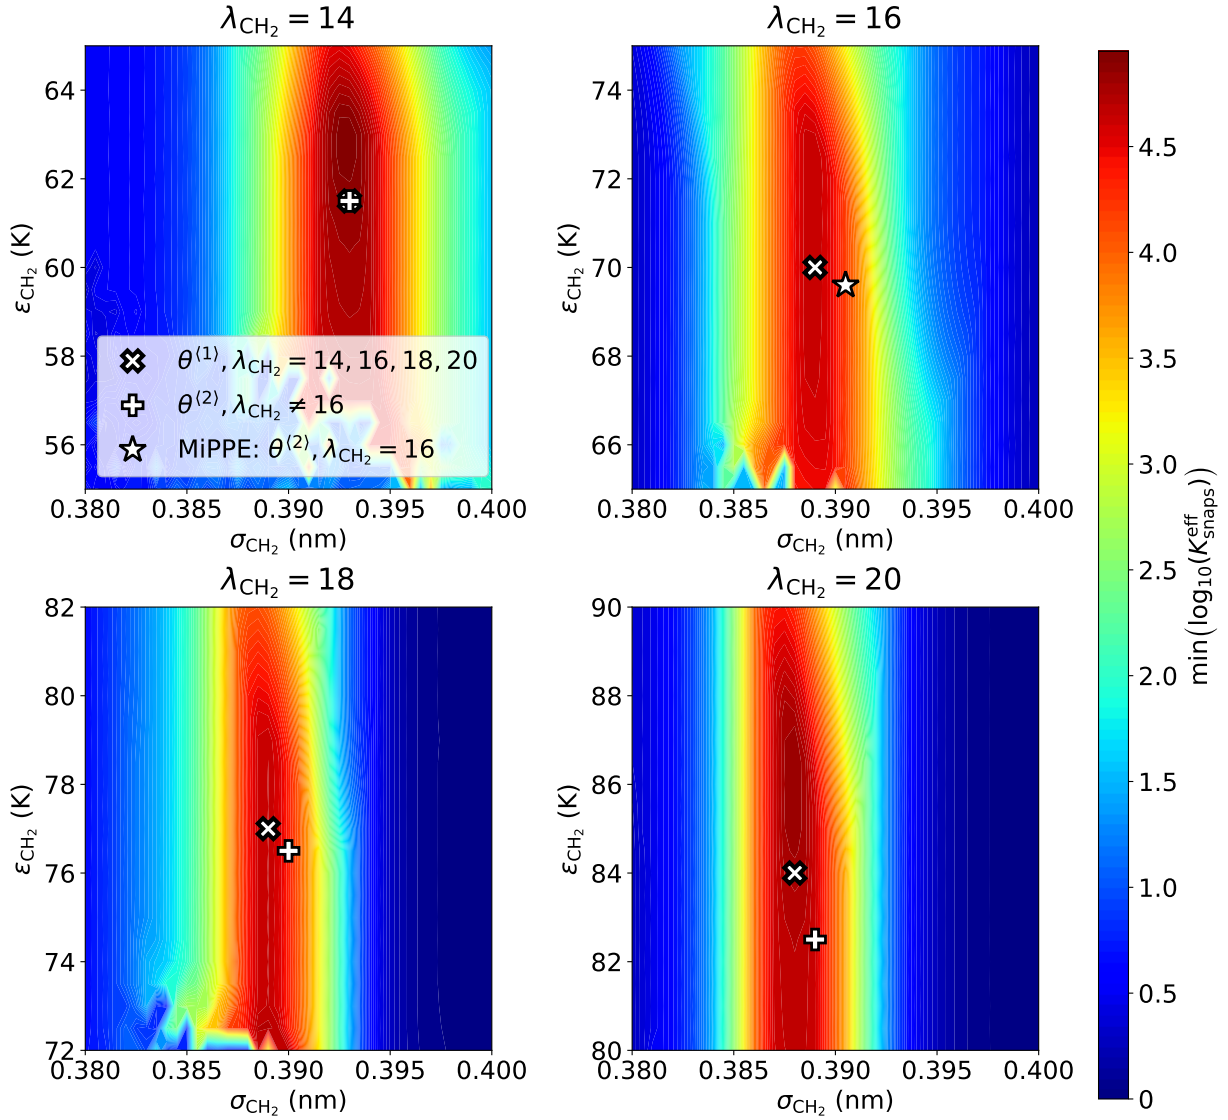

Figure SI.1: Second iteration minimum number of effective snapshots ($\min(K_{\text{snaps}}^{\text{eff}})$) with respect to ϵ_{CH_2} and σ_{CH_2} for cyclohexane. Optimization has converged as $\min(K_{\text{snaps}}^{\text{eff}}) \gg 50$ for the optimal ϵ_{CH_2} , σ_{CH_2} , λ_{CH_2} parameter set. Top-left, top-right, bottom-left, and bottom-right panels correspond $\lambda_{\text{CH}_2} = 14$, $\lambda_{\text{CH}_2} = 16$, $\lambda_{\text{CH}_2} = 18$, and $\lambda_{\text{CH}_2} = 12$, respectively. White star represents the optimal parameter set, i.e., the lowest value of S , for a given λ_{CH_2}

SI.V Compressibility factor

Figure SI.2: Compressibility factor in saturated vapor phase ($Z_{\text{vap}}^{\text{sat}}$) for all compounds simulated in Mick et al. and Soroush Barhaghi et al. Note that symmetric (normal) 95% confidence intervals are ill-suited when $Z_{\text{vap}}^{\text{sat}} \approx 1$, as this assumption can result in $Z_{\text{vap}}^{\text{sat}} > 1$.
